SwiftCart Sales and Pricing Report

Executive summary

Across **20 recorded orders**, SwiftCart generated **143,323** in total sales. **Home** was the leading category, contributing **71,874** (about **50.1%** of recorded sales) across nine orders. Prices span a wide range—from **331** to **3,890**—with evidence of both entry-level and premium-priced offerings.

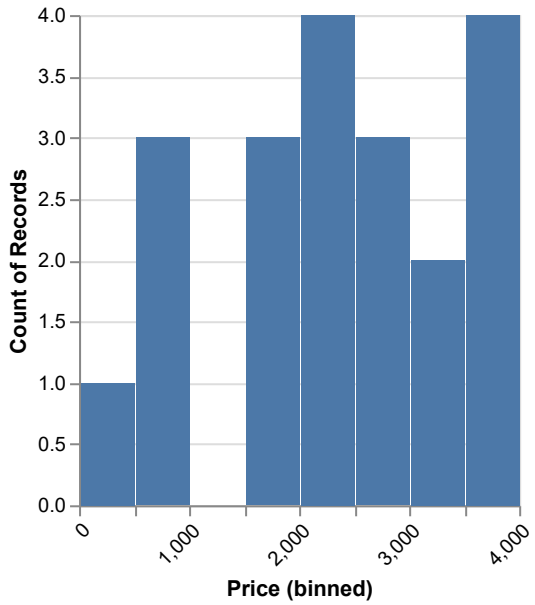

Category sales performance

Rank	Product category	Orders	Total sales	Share of recorded sales
1	Home	9	71,874	50.1%
2	Electronics	6	38,910	27.1%
3	Clothing	4	24,963	17.4%
4	Books	1	7,576	5.3%

Key finding: Home accounts for roughly half of the sales in this extract, making it the clearest priority for inventory availability and further performance review. Electronics is a meaningful secondary contributor, while Books has only one observed order, so its apparent performance is not directly comparable to the other categories.

Price positioning

- The average price is **2,334.05** and the median is **2,288.50**.
- Prices range from **331** to **3,890**.
- **9 of 20** orders (45%) have prices of **2,500 or higher**, indicating substantial premium-price representation.
- The distribution shows a low-price cluster and higher-priced groups, with few observations around the lower-mid-price range.

This mix suggests SwiftCart is serving more than one price tier. The low-price products can support accessibility, whereas premium items warrant close tracking because they can materially affect sales even with fewer units.

Supporting operating indicators

Metric	Recorded value
Average quantity per order	3.05
Median quantity per order	3
Average customer rating	3.86 / 5
Median customer rating	4.00 / 5
Average sales per order	7,166.15

Median sales per order	4,970.00

The difference between average and median sales per order suggests a number of larger transactions lift the overall average. Ratings are generally favorable in this sample, but category-level rating differences should be interpreted cautiously given the small counts.

Recommended actions

1. **Protect Home-category availability.** Its 71,874 in recorded sales makes stockouts in this category potentially costly.
2. **Evaluate the price architecture.** Test whether an intentional offering in the lower-mid-price gap would broaden choice without cannibalizing existing tiers.
3. **Prioritize premium items selectively.** Track sales, quantity, and ratings together rather than using price alone to guide replenishment.
4. **Collect more observations before broad category decisions.** Books has one order in this dataset, and the entire analysis covers only 20 orders.

Limitations

This report reflects the provided **20-order** SwiftCart extract only. It contains no order dates, product identifiers, costs, margins, customer segments, or inventory levels. Therefore, it supports a descriptive view of recorded sales and prices—not conclusions about trends, profitability, customer demand over time, or causal effects.
